This comprehensive overview explores the architecture, components, and development aspects of WiFi support within the Linux kernel, offering insights into how wireless connectivity is achieved, maintained, and optimized on Linux platforms.

Introduction to WiFi in the Linux Kernel

Wireless fidelity (WiFi) has become an essential aspect of modern computing, facilitating mobility and convenience. Linux's support for WiFi has evolved significantly over the years, moving from basic drivers to a sophisticated, modular framework capable of supporting a broad spectrum of hardware.

The Linux kernel's WiFi subsystem enables devices to discover, connect, and communicate over wireless networks by integrating drivers, protocols, and user-space tools. It acts as the core

interface between hardware devices and user-space applications such as NetworkManager, wpa_supplicant, and others that facilitate network management.

Architecture of WiFi Support in the Linux Kernel

The Linux kernel's WiFi support is structured into several layers and components, each responsible for specific functionalities. Understanding this architecture is key to grasping how wireless networking operates within Linux.

Hardware Drivers Layer

This is the lowest level of the WiFi subsystem, directly interacting with wireless hardware devices. Drivers in this layer are responsible for:

- Initializing hardware
- Managing hardware-specific operations
- Handling data transmission and reception
- Implementing hardware capabilities such as power management and scanning

Examples include drivers for Intel (iwlwifi), Realtek (rtl8192), and Broadcom chipsets.

mac80211 Framework

At the core of Linux wireless support lies the mac80211 subsystem, a generic IEEE 802.11 networking stack implemented within the kernel. It provides a standardized interface for wireless device drivers, enabling:

- Management of wireless-specific functions such as scanning, association, and roaming
- Handling of multiple modes like station, access point, mesh, and monitor
- Implementation of various 802.11 standards (a/b/g/n/ac/ax)

The mac80211 layer manages the high-level WiFi operations, abstracting hardware specifics and providing a common API for device drivers.

Wireless Extensions and cfg80211
